## Lab 4: 3D Object Transformation - Texture Mapping

### 1. 3D Object Creation

#### a. Example code

```
/*
 * OGL01Shape3D.cpp: 3D Shapes
 */
#include <windows.h> // for MS Windows
#include <GL/glut.h> // GLUT, include glu.h and gl.h

/* Global variables */
char title[] = "3D Shapes";

/* Initialize OpenGL Graphics */
void initGL() {
    glClearColor(0.0f, 0.0f, 0.0f, 1.0f); // Set background color to black and opaque
    glClearDepth(1.0f); // Set background depth to farthest
    glEnable(GL_DEPTH_TEST); // Enable depth testing for z-culling
    glDepthFunc(GL_LEQUAL); // Set the type of depth-test
    glShadeModel(GL_SMOOTH); // Enable smooth shading
    glHint(GL_PERSPECTIVE_CORRECTION_HINT, GL_NICEST); // Nice perspective corrections
}

/* Handler for window-repaint event. Called back when the window first appears and
 whenever the window needs to be re-painted. */
void display() {
    glClear(GL_COLOR_BUFFER_BIT | GL_DEPTH_BUFFER_BIT); // Clear color and depth buffers
    glMatrixMode(GL_MODELVIEW); // To operate on model-view matrix

    // Render a color-cube consisting of 6 quads with different colors
    glLoadIdentity(); // Reset the model-view matrix
    glTranslatef(1.5f, 0.0f, -7.0f); // Move right and into the screen

    glBegin(GL_QUADS); // Begin drawing the color cube with 6 quads
        // Top face (y = 1.0f)
        // Define vertices in counter-clockwise (CCW) order with normal pointing out
        glColor3f(0.0f, 1.0f, 0.0f); // Green
        glVertex3f( 1.0f, 1.0f, -1.0f);
        glVertex3f(-1.0f, 1.0f, -1.0f);
        glVertex3f(-1.0f, 1.0f,  1.0f);
        glVertex3f( 1.0f, 1.0f,  1.0f);

        // Bottom face (y = -1.0f)
        glColor3f(1.0f, 0.5f, 0.0f); // Orange
        glVertex3f( 1.0f, -1.0f,  1.0f);
        glVertex3f(-1.0f, -1.0f,  1.0f);
        glVertex3f(-1.0f, -1.0f, -1.0f);
        glVertex3f( 1.0f, -1.0f, -1.0f);
    glEnd();
}
```

```

// Front face (z = 1.0f)
glColor3f(1.0f, 0.0f, 0.0f);    // Red
glVertex3f( 1.0f,  1.0f, 1.0f);
glVertex3f(-1.0f,  1.0f, 1.0f);
glVertex3f(-1.0f, -1.0f, 1.0f);
glVertex3f( 1.0f, -1.0f, 1.0f);

// Back face (z = -1.0f)
glColor3f(1.0f, 1.0f, 0.0f);    // Yellow
glVertex3f( 1.0f, -1.0f, -1.0f);
glVertex3f(-1.0f, -1.0f, -1.0f);
glVertex3f(-1.0f,  1.0f, -1.0f);
glVertex3f( 1.0f,  1.0f, -1.0f);

// Left face (x = -1.0f)
glColor3f(0.0f, 0.0f, 1.0f);    // Blue
glVertex3f(-1.0f,  1.0f, 1.0f);
glVertex3f(-1.0f,  1.0f, -1.0f);
glVertex3f(-1.0f, -1.0f, -1.0f);
glVertex3f(-1.0f, -1.0f,  1.0f);

// Right face (x = 1.0f)
glColor3f(1.0f, 0.0f, 1.0f);    // Magenta
glVertex3f( 1.0f,  1.0f, -1.0f);
glVertex3f( 1.0f,  1.0f,  1.0f);
glVertex3f( 1.0f, -1.0f,  1.0f);
glVertex3f( 1.0f, -1.0f, -1.0f);
glEnd(); // End of drawing color-cube

// Render a pyramid consists of 4 triangles
glLoadIdentity();              // Reset the model-view matrix
glTranslatef(-1.5f, 0.0f, -6.0f); // Move left and into the screen

glBegin(GL_TRIANGLES);         // Begin drawing the pyramid with 4 triangles
// Front
glColor3f(1.0f, 0.0f, 0.0f);    // Red
glVertex3f( 0.0f, 1.0f, 0.0f);
glColor3f(0.0f, 1.0f, 0.0f);    // Green
glVertex3f(-1.0f, -1.0f, 1.0f);
glColor3f(0.0f, 0.0f, 1.0f);    // Blue
glVertex3f( 1.0f, -1.0f, 1.0f);

// Right
glColor3f(1.0f, 0.0f, 0.0f);    // Red
glVertex3f( 0.0f, 1.0f, 0.0f);
glColor3f(0.0f, 0.0f, 1.0f);    // Blue
glVertex3f( 1.0f, -1.0f, 1.0f);
glColor3f(0.0f, 1.0f, 0.0f);    // Green
glVertex3f( 1.0f, -1.0f, -1.0f);

// Back
glColor3f(1.0f, 0.0f, 0.0f);    // Red
glVertex3f( 0.0f, 1.0f, 0.0f);
glColor3f(0.0f, 1.0f, 0.0f);    // Green
glVertex3f( 1.0f, -1.0f, -1.0f);
glColor3f(0.0f, 0.0f, 1.0f);    // Blue
glVertex3f(-1.0f, -1.0f, -1.0f);

// Left

```

```

        glColor3f(1.0f,0.0f,0.0f);    // Red
        glVertex3f( 0.0f, 1.0f, 0.0f);
        glColor3f(0.0f,0.0f,1.0f);    // Blue
        glVertex3f(-1.0f,-1.0f,-1.0f);
        glColor3f(0.0f,1.0f,0.0f);    // Green
        glVertex3f(-1.0f,-1.0f, 1.0f);
    glEnd();    // Done drawing the pyramid

    glutSwapBuffers(); // Swap the front and back frame buffers (double buffering)
}

/* Handler for window re-size event. Called back when the window first appears and
   whenever the window is re-sized with its new width and height */
void reshape(GLsizei width, GLsizei height) { // GLsizei for non-negative integer
    // Compute aspect ratio of the new window
    if (height == 0) height = 1;             // To prevent divide by 0
    GLfloat aspect = (GLfloat)width / (GLfloat)height;

    // Set the viewport to cover the new window
    glViewport(0, 0, width, height);

    // Set the aspect ratio of the clipping volume to match the viewport
    glMatrixMode(GL_PROJECTION); // To operate on the Projection matrix
    glLoadIdentity();           // Reset
    // Enable perspective projection with fovy, aspect, zNear and zFar
    gluPerspective(45.0f, aspect, 0.1f, 100.0f);
}

/* Main function: GLUT runs as a console application starting at main() */
int main(int argc, char** argv) {
    glutInit(&argc, argv);           // Initialize GLUT
    glutInitDisplayMode(GLUT_DOUBLE); // Enable double buffered mode
    glutInitWindowSize(640, 480);    // Set the window's initial width & height
    glutInitWindowPosition(50, 50);  // Position the window's initial top-left corner
    glutCreateWindow(title);         // Create window with the given title
    glutDisplayFunc(display);        // Register callback handler for window re-paint event
    glutReshapeFunc(reshape);        // Register callback handler for window re-size event
    initGL();                        // Our own OpenGL initialization
    glutMainLoop();                  // Enter the infinite event-processing loop
    return 0;
}

```

## b. Source code explanation

### GLUT Setup - main()

The program contains a `initGL()`, `display()` and `reshape()` functions. The `main()` program:

- `glutInit(&argc, argv);`
  - Initializes the GLUT.
- `glutInitWindowSize(640, 480);`
- `glutInitWindowPosition(50, 50);`
- `glutCreateWindow(title);`

- Creates a window with a title, initial width and height positioned at initial top-left corner.
- `glutDisplayFunc(display);`
  - Registers `display()` as the re-paint event handler. That is, the graphics sub-system calls `back display()` when the window first appears and whenever there is a re-paint request.
- `glutReshapeFunc(reshape);`
  - Registers `reshape()` as the re-sized event handler. That is, the graphics sub-system calls `back reshape()` when the window first appears and whenever the window is re-sized.
- `glutInitDisplayMode(GLUT_DOUBLE);`
  - Enables double buffering. In `display()`, we use `glutSwapBuffers()` to signal to the GPU to swap the front-buffer and back-buffer during the next VSync (Vertical Synchronization).
- `initGL();`
  - Invokes the `initGL()` once to perform all one-time initialization tasks.
- `glutMainLoop();`
  - Finally, enters the event-processing loop.

### One-Time Initialization Operations - `initGL()`

The `initGL()` function performs the one-time initialization tasks. It is invoked from `main()` once (and only once).

- `glClearColor(0.0f, 0.0f, 0.0f, 1.0f);`
  - Set background color to black and opaque
- `glClearDepth(1.0f);`
  - Set background depth to farthest
- `glClear(GL_COLOR_BUFFER_BIT | GL_DEPTH_BUFFER_BIT);`
  - Set the clearing (background) color to black (R=0, G=0, B=0) and opaque (A=1), and the clearing (background) depth to the farthest (Z=1). In `display()`, we invoke `glClear()` to clear the color and depth buffer, with the clearing color and depth, before rendering the graphics. (Besides the color buffer and depth buffer, OpenGL also maintains an accumulation buffer and a stencil buffer which shall be discussed later.)
- `glEnable(GL_DEPTH_TEST);`
  - Enable depth testing for z-culling
- `glDepthFunc(GL_LEQUAL);`
  - Set the type of depth-test
  - We need to enable depth-test to remove the hidden surface, and set the function used for the depth test.
- `glShadeModel(GL_SMOOTH);`
  - Enable smooth shading
  - We enable smooth shading in color transition. The alternative is `GL_FLAT`. Try it out and see the difference.
- `glHint(GL_PERSPECTIVE_CORRECTION_HINT, GL_NICEST);`

- Nice perspective corrections

In graphics rendering, there is often a trade-off between processing speed and visual quality. We can use `glHint()` to decide on the trade-off. In this case, we ask for the best perspective correction, which may involve more processing. The default is `GL_DONT_CARE`.

### Defining the Color-cube and Pyramid

OpenGL's object is made up of primitives (such as triangle, quad, polygon, point and line). A primitive is defined via one or more vertices. The color-cube is made up of 6 quads. Each quad is made up of 4 vertices, defined in counter-clockwise (CCW) order, such as the normal vector is pointing out, indicating the front face. All the 4 vertices have the same color. The color-cube is defined in its local space (called model space) with origin at the center of the cube with sides of 2 units.

Similarly, the pyramid is made up of 4 triangles (without the base). Each triangle is made up of 3 vertices, defined in CCW order. The 5 vertices of the pyramid are assigned different colors. The color of the triangles are interpolated (and blend smoothly) from its 3 vertices. Again, the pyramid is defined in its local space with origin at the center of the pyramid.

### Model Transform

The objects are defined in their local spaces (model spaces). We need to transform them to the common world space, known as model transform.

To perform model transform, we need to operate on the so-called model-view matrix (OpenGL has a few transformation matrices), by setting the current matrix mode to model-view matrix:

- `glMatrixMode(GL_MODELVIEW); // To operate on model-view matrix`

We perform translations on cube and pyramid, respectively, to position them on the world space:

- `// Color-cube`
- `glLoadIdentity(); // Reset model-view matrix`
- `glTranslatef(1.5f, 0.0f, -7.0f); // Move right and into the screen`
- `// Pyramid`
- `glLoadIdentity();`
- `glTranslatef(-1.5f, 0.0f, -6.0f); // Move left and into the screen`

## View Transform

The default camera position is:

- `gluLookAt(0.0, 0.0, 0.0, 0.0, 0.0, -100.0, 0.0, 1.0, 0.0)`

That is, EYE=(0,0,0) at the origin, AT=(0,0,-100) pointing at negative-z axis (into the screen), and UP=(0,1,0) corresponds to y-axis.

OpenGL graphics rendering pipeline performs so-called view transform to bring the world space to camera's view space. In the case of the default camera position, no transform is needed.

## Viewport Transform

```
void reshape(GLsizei width, GLsizei height) {  
    glViewport(0, 0, width, height);  
    ...  
}
```

The graphics sub-system calls back `reshape()` when the window first appears and whenever the window is resized, given the new window's width and height, in pixels. We set our application viewport to cover the entire window, top-left corner at (0, 0) of width and height, with default minZ of 0 and maxZ of 1. We also use the same aspect ratio of the viewport for the projection view frustum to prevent distortion. In the viewport, a pixel has (x, y) value as well as z-value for depth processing.

## Projection Transform

- `GLfloat aspect = (GLfloat)width / (GLfloat)height; // Compute aspect ratio of window`
- `glMatrixMode(GL_PROJECTION); // To operate on the Projection matrix`
- `glLoadIdentity(); // Reset`
- `gluPerspective(45.0f, aspect, 0.1f, 100.0f); // Perspective projection: fovy, aspect, near, far`

A camera has limited field of view. The projection models the view captured by the camera. There are two types of projection: perspective projection and orthographic projection. In perspective projection, object further to the camera appears smaller compared with object of the same size nearer to the camera. In orthographic projection, the objects appear the same regardless of the z-value. Orthographic projection is a special case of perspective projection where the camera is placed very far away. We shall discuss the orthographic projection in the later example.

To set the projection, we need to operate on the projection matrix. (Recall that we operated on the model-view matrix in model transform.)

We set the matrix mode to projection matrix and reset the matrix. We use the `gluPerspective()` to enable perspective projection, and set the fovy (view angle from the bottom-plane to the top-plane), aspect ratio (width/height), zNear and zFar of the View Frustum (truncated pyramid). In this example, we set the fovy to 45°. We use the same aspect ratio as the viewport to avoid distortion. We set the zNear to 0.1 and zFar to 100 (z=-100). Take that note the color-cube (1.5, 0, -7) and the pyramid (-1.5, 0, -6) are contained within the View Frustum.

The projection transform transforms the view frustum to a 2x2x1 cuboid clipping-volume centered on the near plane (z=0). The subsequent viewport transform transforms the clipping-volume to the viewport in screen space. The viewport is set earlier via the `glViewport()` function.

## 2. 3D Object with animation

### a. Example code

```
/*
 * OGL02Animation.cpp: 3D Shapes with animation
 */
#include <windows.h> // for MS Windows
#include <GL/glut.h> // GLUT, include glu.h and gl.h

/* Global variables */
char title[] = "3D Shapes with animation";
GLfloat anglePyramid = 0.0f; // Rotational angle for pyramid [NEW]
GLfloat angleCube = 0.0f; // Rotational angle for cube [NEW]
int refreshMills = 15; // refresh interval in milliseconds [NEW]

/* Initialize OpenGL Graphics */
void initGL() {
    glClearColor(0.0f, 0.0f, 0.0f, 1.0f); // Set background color to black and opaque
    glClearDepth(1.0f); // Set background depth to farthest
    glEnable(GL_DEPTH_TEST); // Enable depth testing for z-culling
    glDepthFunc(GL_LEQUAL); // Set the type of depth-test
    glShadeModel(GL_SMOOTH); // Enable smooth shading
    glHint(GL_PERSPECTIVE_CORRECTION_HINT, GL_NICEST); // Nice perspective corrections
}

/* Handler for window-repaint event. Called back when the window first appears and
 whenever the window needs to be re-painted. */
void display() {
    glClear(GL_COLOR_BUFFER_BIT | GL_DEPTH_BUFFER_BIT); // Clear color and depth buffers
    glMatrixMode(GL_MODELVIEW); // To operate on model-view matrix

    // Render a color-cube consisting of 6 quads with different colors
    glLoadIdentity(); // Reset the model-view matrix
    glTranslatef(1.5f, 0.0f, -7.0f); // Move right and into the screen
    glRotatef(angleCube, 1.0f, 1.0f, 1.0f); // Rotate about (1,1,1)-axis [NEW]

    glBegin(GL_QUADS); // Begin drawing the color cube with 6 quads
        // Top face (y = 1.0f)
        // Define vertices in counter-clockwise (CCW) order with normal pointing out
        glColor3f(0.0f, 1.0f, 0.0f); // Green
        glVertex3f( 1.0f, 1.0f, -1.0f);
        glVertex3f(-1.0f, 1.0f, -1.0f);
        glVertex3f(-1.0f, 1.0f, 1.0f);
        glVertex3f( 1.0f, 1.0f, 1.0f);

        // Bottom face (y = -1.0f)
        glColor3f(1.0f, 0.5f, 0.0f); // Orange
        glVertex3f( 1.0f, -1.0f, 1.0f);
        glVertex3f(-1.0f, -1.0f, 1.0f);
        glVertex3f(-1.0f, -1.0f, -1.0f);
        glVertex3f( 1.0f, -1.0f, -1.0f);

        // Front face (z = 1.0f)
        glColor3f(1.0f, 0.0f, 0.0f); // Red
        glVertex3f( 1.0f, 1.0f, 1.0f);
```

```

glVertex3f(-1.0f, 1.0f, 1.0f);
glVertex3f(-1.0f, -1.0f, 1.0f);
glVertex3f( 1.0f, -1.0f, 1.0f);

// Back face (z = -1.0f)
glColor3f(1.0f, 1.0f, 0.0f); // Yellow
glVertex3f( 1.0f, -1.0f, -1.0f);
glVertex3f(-1.0f, -1.0f, -1.0f);
glVertex3f(-1.0f, 1.0f, -1.0f);
glVertex3f( 1.0f, 1.0f, -1.0f);

// Left face (x = -1.0f)
glColor3f(0.0f, 0.0f, 1.0f); // Blue
glVertex3f(-1.0f, 1.0f, 1.0f);
glVertex3f(-1.0f, 1.0f, -1.0f);
glVertex3f(-1.0f, -1.0f, -1.0f);
glVertex3f(-1.0f, -1.0f, 1.0f);

// Right face (x = 1.0f)
glColor3f(1.0f, 0.0f, 1.0f); // Magenta
glVertex3f(1.0f, 1.0f, -1.0f);
glVertex3f(1.0f, 1.0f, 1.0f);
glVertex3f(1.0f, -1.0f, 1.0f);
glVertex3f(1.0f, -1.0f, -1.0f);
glEnd(); // End of drawing color-cube

// Render a pyramid consists of 4 triangles
glLoadIdentity(); // Reset the model-view matrix
glTranslatef(-1.5f, 0.0f, -6.0f); // Move left and into the screen
glRotatef(anglePyramid, 1.0f, 1.0f, 0.0f); // Rotate about the (1,1,0)-axis [NEW]

glBegin(GL_TRIANGLES); // Begin drawing the pyramid with 4 triangles
// Front
glColor3f(1.0f, 0.0f, 0.0f); // Red
glVertex3f( 0.0f, 1.0f, 0.0f);
glColor3f(0.0f, 1.0f, 0.0f); // Green
glVertex3f(-1.0f, -1.0f, 1.0f);
glColor3f(0.0f, 0.0f, 1.0f); // Blue
glVertex3f(1.0f, -1.0f, 1.0f);

// Right
glColor3f(1.0f, 0.0f, 0.0f); // Red
glVertex3f(0.0f, 1.0f, 0.0f);
glColor3f(0.0f, 0.0f, 1.0f); // Blue
glVertex3f(1.0f, -1.0f, 1.0f);
glColor3f(0.0f, 1.0f, 0.0f); // Green
glVertex3f(1.0f, -1.0f, -1.0f);

// Back
glColor3f(1.0f, 0.0f, 0.0f); // Red
glVertex3f(0.0f, 1.0f, 0.0f);
glColor3f(0.0f, 1.0f, 0.0f); // Green
glVertex3f(1.0f, -1.0f, -1.0f);
glColor3f(0.0f, 0.0f, 1.0f); // Blue
glVertex3f(-1.0f, -1.0f, -1.0f);

// Left
glColor3f(1.0f,0.0f,0.0f); // Red
glVertex3f( 0.0f, 1.0f, 0.0f);
glColor3f(0.0f,0.0f,1.0f); // Blue

```

```

        glVertex3f(-1.0f,-1.0f,-1.0f);
        glColor3f(0.0f,1.0f,0.0f);    // Green
        glVertex3f(-1.0f,-1.0f, 1.0f);
    glEnd();    // Done drawing the pyramid

    glutSwapBuffers(); // Swap the front and back frame buffers (double buffering)

    // Update the rotational angle after each refresh [NEW]
    anglePyramid += 0.2f;
    angleCube -= 0.15f;
}

/* Called back when timer expired [NEW] */
void timer(int value) {
    glutPostRedisplay();    // Post re-paint request to activate display()
    glutTimerFunc(refreshMills, timer, 0); // next timer call milliseconds later
}

/* Handler for window re-size event. Called back when the window first appears and
whenever the window is re-sized with its new width and height */
void reshape(GLsizei width, GLsizei height) { // GLsizei for non-negative integer
    // Compute aspect ratio of the new window
    if (height == 0) height = 1;    // To prevent divide by 0
    GLfloat aspect = (GLfloat)width / (GLfloat)height;

    // Set the viewport to cover the new window
    glViewport(0, 0, width, height);

    // Set the aspect ratio of the clipping volume to match the viewport
    glMatrixMode(GL_PROJECTION); // To operate on the Projection matrix
    glLoadIdentity();    // Reset
    // Enable perspective projection with fovy, aspect, zNear and zFar
    gluPerspective(45.0f, aspect, 0.1f, 100.0f);
}

/* Main function: GLUT runs as a console application starting at main() */
int main(int argc, char** argv) {
    glutInit(&argc, argv);    // Initialize GLUT
    glutInitDisplayMode(GLUT_DOUBLE); // Enable double buffered mode
    glutInitWindowSize(640, 480); // Set the window's initial width & height
    glutInitWindowPosition(50, 50); // Position the window's initial top-left corner
    glutCreateWindow(title);    // Create window with the given title
    glutDisplayFunc(display);    // Register callback handler for window re-paint event
    glutReshapeFunc(reshape);    // Register callback handler for window re-size event
    initGL();    // Our own OpenGL initialization
    glutTimerFunc(0, timer, 0);    // First timer call immediately [NEW]
    glutMainLoop();    // Enter the infinite event-processing loop
    return 0;
}

```

## b. Source code explanation

The animation codes are:

- `GLfloat anglePyramid = 0.0f; // Rotational angle for pyramid [NEW]`
- `GLfloat angleCube = 0.0f; // Rotational angle for cube [NEW]`
- `int refreshMills = 15; // refresh interval in milliseconds [NEW]`

We define two global variables to keep track of the current rotational angles of the cube and pyramid. We also define the refresh period as 15 msec (66 frames per second).

```
void timer(int value) {
    glutPostRedisplay(); // Post re-paint request to activate display()

    glutTimerFunc(refreshMills, timer, 0); // next timer call milliseconds later
}
```

To perform animation, we define a function called `timer()`, which posts a re-paint request to activate `display()` when the timer expired, and then run the timer again. In `main()`, we perform the first `timer()` call via `glutTimerFunc(0, timer, 0)`.

```
glRotatef(angleCube, 1.0f, 1.0f, 1.0f); // Rotate the cube about (1,1,1)-axis [NEW]
.....
glRotatef(anglePyramid, 1.0f, 1.0f, 0.0f); // Rotate about the (1,1,0)-axis [NEW]
.....
anglePyramid += 0.2f; // update pyramid's angle
angleCube -= 0.15f; // update cube's angle
```

In `display()`, we rotate the cube and pyramid based on their rotational angles, and update the angles after each refresh

### 3. Texture Mapping

#### a. Load texture from file (using [SOIL](#))

```
#include "SOIL.h"
...
```

```

GLuint texture[1];                // Storage For One Texture ( NEW )

...

int loadGLTextures()              // Load Bitmaps And Convert To Textures
{
    /* load an image file directly as a new OpenGL texture */
    texture[0] = SOIL_load_OGL_texture
    (
        "Data/MyImage.bmp",
        SOIL_LOAD_AUTO,
        SOIL_CREATE_NEW_ID,
        SOIL_FLAG_INVERT_Y
    );

    if(texture[0] == 0)
        return false;

    // Typical Texture Generation Using Data From The Bitmap
    glBindTexture(GL_TEXTURE_2D, texture[0]);
    glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_MIN_FILTER, GL_LINEAR);
    glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_MAG_FILTER, GL_LINEAR);

    return true;
}

```

Fist step is linking against the SOIL library. In Visual Studio 2010 this works as follows: Right-click on the project name in the left hand tree-view and choose Properties. There under "Configuration Properties -> Linker -> Input -> Additional Dependencies" we add SOIL.lib by editing the field.

## b. Map texture to object surface

```

int drawGLScene(GLvoid)           // Here's Where We Do All The Drawing
{
    glClear(GL_COLOR_BUFFER_BIT | GL_DEPTH_BUFFER_BIT); // Clear The Screen And The Depth
    Buffer
    glLoadIdentity();             // Reset The View
    glTranslatef(0.0f,0.0f,-5.0f);

    glRotatef(xrot,1.0f,0.0f,0.0f);
    glRotatef(yrot,0.0f,1.0f,0.0f);
    glRotatef(zrot,0.0f,0.0f,1.0f);

    glBindTexture(GL_TEXTURE_2D, texture[0]); // Map your texture here

    glBegin(GL_QUADS);
        // Front Face
        glTexCoord2f(0.0f, 0.0f); glVertex3f(-1.0f, -1.0f, 1.0f);
        glTexCoord2f(1.0f, 0.0f); glVertex3f( 1.0f, -1.0f, 1.0f);

```

```

    glTexCoord2f(1.0f, 1.0f); glVertex3f( 1.0f, 1.0f, 1.0f);
    glTexCoord2f(0.0f, 1.0f); glVertex3f(-1.0f, 1.0f, 1.0f);
    // Back Face
    glTexCoord2f(1.0f, 0.0f); glVertex3f(-1.0f, -1.0f, -1.0f);
    glTexCoord2f(1.0f, 1.0f); glVertex3f(-1.0f, 1.0f, -1.0f);
    glTexCoord2f(0.0f, 1.0f); glVertex3f( 1.0f, 1.0f, -1.0f);
    glTexCoord2f(0.0f, 0.0f); glVertex3f( 1.0f, -1.0f, -1.0f);
    // Top Face
    glTexCoord2f(0.0f, 1.0f); glVertex3f(-1.0f, 1.0f, -1.0f);
    glTexCoord2f(0.0f, 0.0f); glVertex3f(-1.0f, 1.0f, 1.0f);
    glTexCoord2f(1.0f, 0.0f); glVertex3f( 1.0f, 1.0f, 1.0f);
    glTexCoord2f(1.0f, 1.0f); glVertex3f( 1.0f, 1.0f, -1.0f);
    // Bottom Face
    glTexCoord2f(1.0f, 1.0f); glVertex3f(-1.0f, -1.0f, -1.0f);
    glTexCoord2f(0.0f, 1.0f); glVertex3f( 1.0f, -1.0f, -1.0f);
    glTexCoord2f(0.0f, 0.0f); glVertex3f( 1.0f, -1.0f, 1.0f);
    glTexCoord2f(1.0f, 0.0f); glVertex3f(-1.0f, -1.0f, 1.0f);
    // Right face
    glTexCoord2f(1.0f, 0.0f); glVertex3f( 1.0f, -1.0f, -1.0f);
    glTexCoord2f(1.0f, 1.0f); glVertex3f( 1.0f, 1.0f, -1.0f);
    glTexCoord2f(0.0f, 1.0f); glVertex3f( 1.0f, 1.0f, 1.0f);
    glTexCoord2f(0.0f, 0.0f); glVertex3f( 1.0f, -1.0f, 1.0f);
    // Left Face
    glTexCoord2f(0.0f, 0.0f); glVertex3f(-1.0f, -1.0f, -1.0f);
    glTexCoord2f(1.0f, 0.0f); glVertex3f(-1.0f, -1.0f, 1.0f);
    glTexCoord2f(1.0f, 1.0f); glVertex3f(-1.0f, 1.0f, 1.0f);
    glTexCoord2f(0.0f, 1.0f); glVertex3f(-1.0f, 1.0f, -1.0f);
    glEnd();

    xrot+=0.3f;
    yrot+=0.2f;
    zrot+=0.4f;
    return TRUE;
}

```

#### 4. Exercise

##### Output:

- A program that draw all quadric object as described in image above.
  - Objects rotate around their own center rotation axis (clockwise).
  - Objects have random textures (load from file) for each of their surfaces.

**Submit rule:**

- 3 folder, compressed in 1 file **MSSV\_Lab4.zip**
  - Document
  - Release
  - Source
